Piston diaphragm pump

The stroke movement of the mechanically coupled piston is transferred hydraulically to the multi-layer diaphragm.

An integral compensation valve ensures highest dosing accuracy and offers highest overload protection.

In case of unacceptably high counterpressure the hydraulic fluid escapes into the compensating valve.

By using the multi-layer diaphragm these pumps can now handle dosing tasks with higher requirements regarding safety because the diaphragm rupture signalisation (pressure switch, manometer etc.) fulfils such demands.

Furthermore the lifetime of these diaphragms is much higher than the lifetime of single layer diaphragms.
